#### Solving Linear Recurrence Relations of degree k

Consider an arbitrary linear homogeneous relation of degree k with constant coefficients:

$$a_n = \sum_{i=1}^k c_i a_{n-i}.$$

#### Solving Linear Recurrence Relations of degree k

Consider an arbitrary linear homogeneous relation of degree k with constant coefficients:

$$a_n = \sum_{i=1}^k c_i a_{n-i}.$$

The characteristic equation (CE) is:

$$r^{k} - \sum_{i=1}^{k} c_{i} r^{k-i} = 0.$$

#### Solving Linear Recurrence Relations of degree k

Consider an arbitrary linear homogeneous relation of degree k with constant coefficients:

$$a_n = \sum_{i=1}^k c_i a_{n-i}.$$

The characteristic equation (CE) is:

$$r^{k} - \sum_{i=1}^{k} c_{i} r^{k-i} = 0.$$

**Theorem** If this CE has k distinct roots  $r_i$ , then the solutions to the recurrence are of the form

$$a_n = \sum_{i=1}^k \alpha_i r_i^n$$

for all  $n \ge 0$ , where the  $\alpha_i$ 's are constants.

#### The Case of Degenerate Roots

**Theorem** If the CE  $r^2 - c_1 r - c_2 = 0$  has only 1 root  $r_0$ , then

$$a_n = \alpha_1 r_0^n + \alpha_2 n r_0^n,$$

for all  $n \geq 0$  and two constants  $\alpha_1$  and  $\alpha_2$ .

#### The Case of Degenerate Roots

**Theorem** If the CE  $r^2 - c_1 r - c_2 = 0$  has only 1 root  $r_0$ , then

$$a_n = \alpha_1 r_0^n + \alpha_2 n r_0^n,$$

for all  $n \geq 0$  and two constants  $\alpha_1$  and  $\alpha_2$ .

**Theorem** [Theorem 4, p.519] Suppose that there are t roots  $r_1, \ldots, r_t$  with multiplicities  $m_1, \ldots, m_t$ . Then

$$a_n = \sum_{i=1}^t \left( \sum_{j=0}^{m_i-1} \alpha_{i,j} n^j \right) r_i^n,$$

for all  $n \geq 0$  and constants  $\alpha_{i,j}$ .

■ **Definition** A *linear nonhomogeneous relation* with constant coefficients may contain some terms F(n) that depend only on n

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \cdots + c_k a_{n-k} + F(n).$$

The recurrence relation

 $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \cdots + c_k a_{n-k}$  is called the associated homogeneous recurrence relation.

■ **Definition** A *linear nonhomogeneous relation* with constant coefficients may contain some terms F(n) that depend only on n

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \cdots + c_k a_{n-k} + F(n).$$

The recurrence relation

 $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \cdots + c_k a_{n-k}$  is called the associated homogeneous recurrence relation.

**Fact**: Assume that the sequence  $b_n$  satisfies the recurrence. Then another sequece  $a_n$  satisfies the non-homogeneous recurrence if and only if  $h_n = a_n - b_n$  is a sequence that satisfies the associated homogeneous recurrence.

■ **Definition** A *linear nonhomogeneous relation* with constant coefficients may contain some terms F(n) that depend only on n

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \cdots + c_k a_{n-k} + F(n).$$

The recurrence relation

 $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \cdots + c_k a_{n-k}$  is called the associated homogeneous recurrence relation.

**Fact**: Assume that the sequence  $b_n$  satisfies the recurrence. Then another sequece  $a_n$  satisfies the non-homogeneous recurrence if and only if  $h_n = a_n - b_n$  is a sequence that satisfies the associated homogeneous recurrence.

**Idea**: We already know how to find  $h_n$ . For many common F(n), a solution  $b_n$  to the non-homogeneous recurrence is similar to F(n). We then need find  $a_n = b_n + h_n$  to the non-homogeneous recurrence that satisfies both recurrence and initial conditions.

**Theorem** If  $a_n = p(n)$  is any particular solution to the linear nonhomogeneous relation with constant coefficients,

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \cdots + c_k a_{n-k} + F(n),$$

Then all its solutions are of the form

$$a_n = p(n) + h(n),$$

where  $a_n = h(n)$  is any solution to the associated homogeneous recurrence relation

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \cdots + c_k a_{n-k}$$

**Example**  $a_n = 3a_{n-1} + 2n$ . Which solution has  $a_1 = 3$ ?

**Example**  $a_n = 3a_{n-1} + 2n$ . Which solution has  $a_1 = 3$ ?

The *characteristic equation* of the associated linear homogeneous recurrence relation is  $r^2 - 3r = 0$ . Thus, the solution to the original problem are all of the form  $a_n = \alpha 3^n + p(n)$ .

**Example**  $a_n = 3a_{n-1} + 2n$ . Which solution has  $a_1 = 3$ ?

The *characteristic equation* of the associated linear homogeneous recurrence relation is  $r^2 - 3r = 0$ . Thus, the solution to the original problem are all of the form  $a_n = \alpha 3^n + p(n)$ .

We try a degree-t polynomial as the particular solution p(n).

**Example**  $a_n = 3a_{n-1} + 2n$ . Which solution has  $a_1 = 3$ ?

The *characteristic equation* of the associated linear homogeneous recurrence relation is  $r^2 - 3r = 0$ . Thus, the solution to the original problem are all of the form  $a_n = \alpha 3^n + p(n)$ .

We try a degree-t polynomial as the particular solution p(n).

Let 
$$p(n) = cn + d$$
, then  $cn + d = 3(c(n-1) + d) + 2n$ , which means  $(2c + 2)n + (2d - 3c) = 0$ .

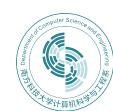

**Example**  $a_n = 3a_{n-1} + 2n$ . Which solution has  $a_1 = 3$ ?

The *characteristic equation* of the associated linear homogeneous recurrence relation is  $r^2 - 3r = 0$ . Thus, the solution to the original problem are all of the form  $a_n = \alpha 3^n + p(n)$ .

We try a degree-t polynomial as the particular solution p(n).

Let 
$$p(n) = cn + d$$
, then  $cn + d = 3(c(n-1) + d) + 2n$ , which means  $(2c+2)n + (2d-3c) = 0$ .

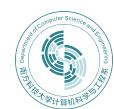

We get 
$$c = -1$$
 and  $d = -3/2$ . Thus,  $p(n) = -n - 3/2$   
6 - 5

**Example Tower of Hanoi.** H(n) = 2H(n-1) + 1 with H(1) = 1.

**Example** Tower of Hanoi. H(n) = 2H(n-1) + 1 with H(1) = 1. The *characteristic equation* of the associated linear homogeneous recurrence relation is  $r^2 - 2r = 0$ . Thus, the solution to the original problem are all of the form  $H(n) = \alpha 2^n + p(n)$ .

**Example** Tower of Hanoi. H(n) = 2H(n-1) + 1 with H(1) = 1. The *characteristic equation* of the associated linear homogeneous recurrence relation is  $r^2 - 2r = 0$ . Thus, the solution to the original problem are all of the form  $H(n) = \alpha 2^n + p(n)$ .

We try a constant c as the particular solution p(n).

**Example** Tower of Hanoi. H(n) = 2H(n-1) + 1 with H(1) = 1. The *characteristic equation* of the associated linear homogeneous recurrence relation is  $r^2 - 2r = 0$ . Thus, the solution to the original problem are all of the form  $H(n) = \alpha 2^n + p(n)$ .

We try a constant c as the particular solution p(n).

```
Let p(n) = c, then c = 2c + 1, which means c = -1.
```

**Example** Tower of Hanoi. H(n) = 2H(n-1) + 1 with H(1) = 1. The *characteristic equation* of the associated linear homogeneous recurrence relation is  $r^2 - 2r = 0$ . Thus, the solution to the original problem are all of the form  $H(n) = \alpha 2^n + p(n)$ .

We try a constant c as the particular solution p(n).

Let p(n) = c, then c = 2c + 1, which means c = -1.

We get  $H(n) = \alpha 2^n - 1$ . With the initial condition H(1) = 1, we have  $\alpha = 1$ . Thus,  $H(n) = 2^n - 1$ .

**Example Merge Sort**. T(n) = 2T(n/2) + n - 1 with T(1) = 0.

■ **Example Merge Sort**. T(n) = 2T(n/2) + n - 1 with T(1) = 0. Let  $T(n) = T(2^k) = M(k)$ , then we have  $M(k) = 2M(k-1) + 2^k - 1$  with M(0) = 0.

**Example Merge Sort**. T(n) = 2T(n/2) + n - 1 with T(1) = 0. Let  $T(n) = T(2^k) = M(k)$ , then we have  $M(k) = 2M(k-1) + 2^k - 1$  with M(0) = 0.

The *characteristic equation* of the associated linear homogeneous recurrence relation is  $r^2 - 2r = 0$ . Thus, the solution to the original problem are all of the form  $M(k) = \alpha 2^k + p(k)$ .

**Example Merge Sort**. T(n) = 2T(n/2) + n - 1 with T(1) = 0. Let  $T(n) = T(2^k) = M(k)$ , then we have  $M(k) = 2M(k-1) + 2^k - 1$  with M(0) = 0.

The characteristic equation of the associated linear homogeneous recurrence relation is  $r^2 - 2r = 0$ . Thus, the solution to the original problem are all of the form  $M(k) = \alpha 2^k + p(k)$ .

We try  $c_1k \cdot 2^k + c_2$  as the particular solution p(k). Let  $p(k) = c_1k \cdot 2^k + c_2$ , then  $c_1k \cdot 2^k + c_2 = 2c_1(k-1)2^{k-1} + 2c_2 + 2^k - 1$ , which gives  $c_1 = c_2 = 1$ .

**Example Merge Sort**. T(n) = 2T(n/2) + n - 1 with T(1) = 0. Let  $T(n) = T(2^k) = M(k)$ , then we have  $M(k) = 2M(k-1) + 2^k - 1$  with M(0) = 0.

The *characteristic equation* of the associated linear homogeneous recurrence relation is  $r^2 - 2r = 0$ . Thus, the solution to the original problem are all of the form  $M(k) = \alpha 2^k + p(k)$ .

We try  $c_1k \cdot 2^k + c_2$  as the particular solution p(k). Let  $p(k) = c_1k \cdot 2^k + c_2$ , then  $c_1k \cdot 2^k + c_2 = 2c_1(k-1)2^{k-1} + 2c_2 + 2^k - 1$ , which gives  $c_1 = c_2 = 1$ .

We get  $M(k) = \alpha 2^k + k \cdot 2^k + 1$ . With the initial condition M(0) = 0, we have  $\alpha = -1$ . Thus,  $M(k) = k \cdot 2^k - 2^k + 1$  and  $T(n) = n \log n - n + 1$ .

We may use generating functions to characterize sequences.

# Q-Ary Non-Overlapping Codes: A Generating Function Approach

Geyang Wang and Qi Wang, Member, IEEE

Abstract—Non-overlapping codes are a set of codewords in  $\bigcup_{n\geq 2}\mathbb{Z}_q^n$ , where  $\mathbb{Z}_q=\{0,1,\ldots,q-1\}$ , such that the prefix of each codeword is not a suffix of any codeword in the set, including itself; and for variable-length codes, a codeword does not contain any other codeword as a subword. In this paper, we investigate a generic method to generalize binary codes to q-ary ones for q > 2, and analyze this generalization on the two constructions given by Levenshtein (also by Gilbert; Chee, Kiah, Purkayastha, and Wang) and Bilotta, respectively. The generalization on the former construction gives large non-expandable fixed-length non-overlapping codes whose size can be explicitly determined; the generalization on the latter construction is the first attempt to generate q-ary variable-length non-overlapping codes. More importantly, this generic method allows us to utilize the generating function approach to analyze the cardinality of the underlying q-ary non-overlapping codes. The generating function approach not only enables us to derive new results, e.g., recurrence relations on their cardinalities, new combinatorial interpretations for the constructions, and the superior limit of their cardinalities for some special cases, but also greatly simplifies the arguments for these results. Furthermore, we give an exact formula for the number of fixed-length words that do not contain the codewords in a variable-length non-overlapping code as subwords. This thereby solves an open problem by Bilotta and induces a recursive upper bound on the maximum size of variable-length non-overlapping codes.

Index Terms—Non-overlapping code, variable-length code, generating function.

- (1) No non-empty prefix of each codeword is a suffix of any one, including itself;
- (2) For all distinct  $\mathbf{u}, \mathbf{v} \in S$ ,  $\mathbf{u}$  does not contain  $\mathbf{v}$  as a subword.

We say that S is a fixed-length non-overlapping code if  $S \subseteq \mathbb{Z}_q^n$ , otherwise it is called a variable-length nonoverlapping code. In this paper, we consider both fixedlength and variable-length cases. Fixed-length non-overlapping codes have been intensively studied in the literature. Let C(n,q) be the maximum size of a q-ary non-overlapping codes of length n. The main research problems are to construct non-overlapping codes as large as possible in size and to bound C(n,q). The first construction was proposed by Levenshtein in 1964 [2], [3] (Construction 1, see also [4]–[6]). Following the work by de Lind van Wijngaarden and Willink [7] in 2000, Bajic and Stojanovic [8] independently rediscovered binary fixed-length non-overlapping codes (under the name cross-bifix-free codes) in 2004. In 2012, Bilotta et al. [9] provided a binary construction based on Dyck paths, by which the code size is smaller than Levenshtein's. However, it reveals an interesting connection between non-overlapping codes and other combinatorial objects. In 2013, Chee et al. [6] rediscovered Levenshtein's construction (Construction 1), and verified that it is optimal for q =

#### Generating Functions for Finite Sequences

**Example**. There are **two** types of balls, blue and red. Let  $d_k$  be the # of ways to select k blue or red balls, and D(x) be its generating function.

**Convolution Rule**. Let A(x) be the generating function for selecting items from a set A, and let B(x) be the generating function for selecting items from a set B disjoint from A. Then the generating function for selecting items from the union  $A \cup B$  is the product  $A(x) \cdot B(x)$ .

**Example**. There are **two** types of balls, blue and red. Let  $d_k$  be the # of ways to select k blue or red balls, and D(x) be its generating function.

$$d_k = k + 1$$
,  $D(x) = 1/(1-x)^2$ .

**Convolution Rule**. Let A(x) be the generating function for selecting items from a set A, and let B(x) be the generating function for selecting items from a set B disjoint from A. Then the generating function for selecting items from the union  $A \cup B$  is the product  $A(x) \cdot B(x)$ .

**Example**. There are **two** types of balls, blue and red.

Let  $d_k$  be the # of ways to select k blue or red balls, and D(x) be its generating function.

$$d_k = k + 1, D(x) = 1/(1-x)^2.$$

This can be generalized to counting the # of ways to select k balls with  $\mathbf{n}$  colors.

$$D(x) = 1/(1-x)^n$$
, what is  $d_k$ ?

■ This can be generalized to counting the # of ways to select k balls with  $\mathbf{n}$  colors.

$$D(x) = 1/(1-x)^n$$
, what is  $d_k$ ?

■ This can be generalized to counting the # of ways to select k balls with  $\mathbf{n}$  colors.

$$D(x) = 1/(1-x)^n$$
, what is  $d_k$ ?

$$d_k = [x^k](1/(1-x)^n) = \binom{n+k-1}{k}$$

■ This can be generalized to counting the # of ways to select k balls with  $\mathbf{n}$  colors.

$$D(x) = 1/(1-x)^n$$
, what is  $d_k$ ?

$$d_k = [x^k](1/(1-x)^n) = \binom{n+k-1}{k}$$

Theorem (Maclaurin's Theorem).

$$f(x) = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \frac{f'''(0)}{3!}x^3 + \dots + \frac{f^{(n)}(0)}{n!}x^n + \dots$$

$$\frac{d^k}{d^k x}(1/(1-x)^n) = n(n+1)\cdots(n+k-1)(1-x)^{-(n+k)}$$

$$[x^k](1/(1-x)^n) = \frac{n(n+1)\cdots(n+k-1)(1-0)^{-(n+k)}}{k!} = \binom{n+k-1}{k}$$

■ This can be generalized to counting the # of ways to select k balls with  $\mathbf{n}$  colors.

$$D(x) = 1/(1-x)^n$$
, what is  $d_k$ ?

$$d_k = [x^k](1/(1-x)^n) = \binom{n+k-1}{k}$$

Theorem (Maclaurin's Theorem).

$$f(x) = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \frac{f'''(0)}{3!}x^3 + \dots + \frac{f^{(n)}(0)}{n!}x^n + \dots$$

$$\frac{d^k}{d^k x}(1/(1-x)^n) = n(n+1)\cdots(n+k-1)(1-x)^{-(n+k)}$$

$$[x^k](1/(1-x)^n) = \frac{n(n+1)\cdots(n+k-1)(1-0)^{-(n+k)}}{k!} = \binom{n+k-1}{k}$$

Alternatively, apply the extended binomial theorem:

$$\binom{-n}{k} = \frac{(-n)(-n-1)\cdots(-n-k+1)}{k!} = (-1)^k \frac{(n+k-1)\cdots(n+1)n}{k!} = (-1)^k \binom{n+k-1}{k}$$

$$(1+x)^n = \sum_{k=0}^n C(n,k)x^k$$
$$(1+ax)^n = \sum_{k=0}^n C(n,k)a^kx^k$$
$$(1+x^r)^n = \sum_{k=0}^n C(n,k)x^{rk}$$

$$(1+x)^{n} = \sum_{k=0}^{n} C(n,k)x^{k}$$

$$(1+ax)^{n} = \sum_{k=0}^{n} C(n,k)a^{k}x^{k}$$

$$(1+x^{r})^{n} = \sum_{k=0}^{n} C(n,k)x^{rk}$$

$$\frac{1-x^{n+1}}{1-x} = \sum_{k=0}^{n} x^{k} = 1+x+x^{2}+\cdots+x^{n}$$

$$\frac{1}{1-x} = \sum_{k=0}^{\infty} x^{k} = 1+x+x^{2}+\cdots$$

$$\frac{1}{1-ax} = \sum_{k=0}^{\infty} a^{k}x^{k} = 1+ax+a^{2}x^{2}+\cdots$$

$$\frac{1}{1-x^{r}} = \sum_{k=0}^{\infty} x^{rk} = 1+x^{r}+x^{2r}+\cdots$$

$$(1+x)^{n} = \sum_{k=0}^{n} C(n,k)x^{k}$$

$$(1+ax)^{n} = \sum_{k=0}^{n} C(n,k)a^{k}x^{k}$$

$$(1+x^{r})^{n} = \sum_{k=0}^{n} C(n,k)x^{rk}$$

$$\frac{1-x^{n+1}}{1-x} = \sum_{k=0}^{n} x^{k} = 1+x+x^{2}+\cdots+x^{n}$$

$$\frac{1}{1-x} = \sum_{k=0}^{\infty} x^{k} = 1+x+x^{2}+\cdots$$

$$\frac{1}{1-ax} = \sum_{k=0}^{\infty} a^{k}x^{k} = 1+ax+a^{2}x^{2}+\cdots$$

$$\frac{1}{1-x^{r}} = \sum_{k=0}^{\infty} a^{k}x^{k} = 1+x^{r}+x^{2r}+\cdots$$

$$\frac{1}{1-x^{r}} = \sum_{k=0}^{\infty} x^{rk} = 1+x^{r}+x^{2r}+\cdots$$

$$\frac{1}{(1-x)^{2}} = \sum_{k=0}^{\infty} (k+1)x^{k} = 1+2x+3x^{2}+\cdots$$

$$\frac{1}{(1-x)^n} = \sum_{k=0}^{\infty} C(n+k-1,k)x^k$$

$$\frac{1}{(1+x)^n} = \sum_{k=0}^{\infty} C(n+k-1,k)(-1)^k x^k$$

$$\frac{1}{(1-ax)^n} = \sum_{k=0}^{\infty} C(n+k-1,k)a^k x^k$$

$$\frac{1}{(1-x)^n} = \sum_{k=0}^{\infty} C(n+k-1,k)x^k$$

$$\frac{1}{(1+x)^n} = \sum_{k=0}^{\infty} C(n+k-1,k)(-1)^k x^k$$

$$\frac{1}{(1-ax)^n} = \sum_{k=0}^{\infty} C(n+k-1,k)a^k x^k$$

$$e^{x} = \sum_{k=0}^{\infty} \frac{x^{k}}{k!} = 1 + x + \frac{x^{2}}{2!} + \frac{x^{3}}{3!} + \cdots$$

$$\ln(1+x) = \sum_{k=0}^{\infty} \frac{(-1)^{k+1}x^k}{k} = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots$$

Problem 1 Find the number of solutions of

$$x_1 + x_2 + x_3 = 17$$
,

where  $x_1, x_2, x_3$  are nonnegative integers with  $2 \le x_1 \le 5$ ,  $3 \le x_2 \le 6$ ,  $4 \le x_3 \le 7$ .

Problem 1 Find the number of solutions of

$$x_1 + x_2 + x_3 = 17$$
,

where  $x_1, x_2, x_3$  are nonnegative integers with  $2 \le x_1 \le 5$ ,  $3 \le x_2 \le 6$ ,  $4 \le x_3 \le 7$ .

Using generating functions, the number is the coefficient of  $x^{17}$  in the expansion of

$$(x^2 + x^3 + x^4 + x^5)(x^3 + x^4 + x^5 + x^6)(x^4 + x^5 + x^6 + x^7)$$

Problem 2 In how many ways can eight identical cookies be distributed among three distinct children if each child receives at least two cookies and no more than four cookies?

Problem 2 In how many ways can eight identical cookies be distributed among three distinct children if each child receives at least two cookies and no more than four cookies?

The coefficient of  $x^8$  in the expansion

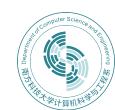

$$(x^2 + x^3 + x^4)^3$$

Problem 3 How many solutions are there to the equation

$$x_1 + x_2 + x_3 = 17$$
,

where  $x_1, x_2, x_3$  are nonnegative integers?

Problem 3 How many solutions are there to the equation

$$x_1 + x_2 + x_3 = 17$$
,

where  $x_1, x_2, x_3$  are nonnegative integers?

This is **equivalent** to the problem of k-combinations from a set with n elements when repetition is allowed.

Problem 3 How many solutions are there to the equation

$$x_1 + x_2 + x_3 = 17$$

where  $x_1, x_2, x_3$  are nonnegative integers?

This is **equivalent** to the problem of k-combinations from a set with n elements when repetition is allowed.

$$C(n+k-1,k)=C(19,17)=C(19,2)$$

■ **Definition** A *k-combination* with repetition allowed, or a *multiset of size k*, chosen from a set of *n* elements, is an unordered selection of elements with repetition allowed.

■ **Definition** A *k-combination* with repetition allowed, or a *multiset of size k*, chosen from a set of *n* elements, is an unordered selection of elements with repetition allowed.

**Example** Find # multisets of size 17 from the set  $\{1, 2, 3\}$ .

■ **Definition** A *k-combination* with repetition allowed, or a *multiset of size k*, chosen from a set of *n* elements, is an unordered selection of elements with repetition allowed.

**Example** Find # multisets of size 17 from the set  $\{1, 2, 3\}$ .

This is equivalent to finding the # nonnegative solutions to  $x_1 + x_2 + x_3 = 17$ .

■ **Definition** A *k-combination* with repetition allowed, or a *multiset of size k*, chosen from a set of *n* elements, is an unordered selection of elements with repetition allowed.

**Example** Find # multisets of size 17 from the set  $\{1, 2, 3\}$ .

This is equivalent to finding the # nonnegative solutions to  $x_1 + x_2 + x_3 = 17$ .

Q: Use generating functions to find the number of k-combinations from a set with n elements when repetition of elements is allowed.

■ **Definition** A *k-combination* with repetition allowed, or a *multiset of size k*, chosen from a set of *n* elements, is an unordered selection of elements with repetition allowed.

**Example** Find # multisets of size 17 from the set  $\{1, 2, 3\}$ .

This is equivalent to finding the # nonnegative solutions to  $x_1 + x_2 + x_3 = 17$ .

Q: Use generating functions to find the number of k-combinations from a set with n elements when repetition of elements is allowed.

Read more on pp. 537-548.

**Problem 4** Use generating functions to find the number of k-combinations of a set with n elements, C(n, k).

**Problem 4** Use generating functions to find the number of k-combinations of a set with n elements, C(n, k).

Each of the n elements in the set contributes the term (1+x) to the generating function  $f(x) = \sum_{k=0}^{n} a^k x^k$ . Hence,  $f(x) = (1+x)^n$ .

Then by the binomial theorem, we have  $a_k = \binom{n}{k}$ .

#### Cartesian Product

Let  $A = \{a_1, a_2, \dots, a_m\}$  and  $B = \{b_1, b_2, \dots, b_n\}$ , the Cartesian product  $A \times B$  is the set of pairs  $\{(a_1, b_1), (a_2, b_2), \dots, (a_1, b_n), \dots, (a_m, b_n)\}$ 

#### Cartesian Product

Let  $A = \{a_1, a_2, \dots, a_m\}$  and  $B = \{b_1, b_2, \dots, b_n\}$ , the Cartesian product  $A \times B$  is the set of pairs  $\{(a_1, b_1), (a_2, b_2), \dots, (a_1, b_n), \dots, (a_m, b_n)\}$ 

Cartesian product defines a set of all ordered arrangements of elements in the two sets.

**Definition**: Let A and B be two sets. A binary relation from A to B is a subset of a Cartesian product  $A \times B$ .

**Definition**: Let A and B be two sets. A binary relation from A to B is a subset of a Cartesian product  $A \times B$ .

Let  $R \subseteq A \times B$  denote R is a set of ordered pairs of the form (a, b) where  $a \in A$  and  $b \in B$ .

**Definition**: Let A and B be two sets. A binary relation from A to B is a subset of a Cartesian product  $A \times B$ .

Let  $R \subseteq A \times B$  denote R is a set of ordered pairs of the form (a, b) where  $a \in A$  and  $b \in B$ .

We use the notation a R b to denote  $(a, b) \in R$ , and aRb to denote  $(a, b) \notin R$ .

**Definition**: Let A and B be two sets. A binary relation from A to B is a subset of a Cartesian product  $A \times B$ .

Let  $R \subseteq A \times B$  denote R is a set of ordered pairs of the form (a, b) where  $a \in A$  and  $b \in B$ .

We use the notation a R b to denote  $(a, b) \in R$ , and aRb to denote  $(a, b) \notin R$ .

**Example**: Let  $A = \{a, b, c\}$  and  $B = \{1, 2, 3\}$ 

- $\diamond$  Is  $R = \{(a,1),(b,2),(c,2)\}$  a relation from A to B?
- $\diamond$  Is  $Q = \{(1, a), (2, b)\}$  a relation from A to B?
- $\diamond$  Is  $P = \{(a, a), (b, c), (b, a)\}$  a relation from A to A?

• We can graphically represent a binary relation R as:

if a R b, then we draw an arrow from a to b:  $a \rightarrow b$ 

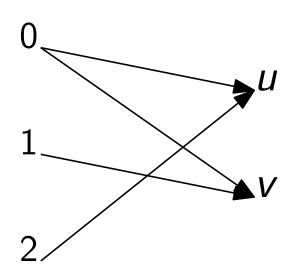

• We can graphically represent a binary relation R as: if a R b, then we draw an arrow from a to b:  $a \rightarrow b$ 

**Example**: Let 
$$A = \{0, 1, 2\}$$
 and  $B = \{u, v\}$ , and  $R = \{(0, u), (0, v), (1, v), (2, u)\}$ .  $(R \subseteq A \times B)$ 

• We can graphically represent a binary relation R as: if a R b, then we draw an arrow from a to b:  $a \rightarrow b$ 

**Example**: Let  $A = \{0, 1, 2\}$  and  $B = \{u, v\}$ , and  $R = \{(0, u), (0, v), (1, v), (2, u)\}$ .  $(R \subseteq A \times B)$ 

• We can also represent a binary relation R by a table showing the ordered pairs of R.

• We can also represent a binary relation R by a table showing the ordered pairs of R.

**Example**: Let 
$$A = \{0, 1, 2\}$$
 and  $B = \{u, v\}$ , and  $R = \{(0, u), (0, v), (1, u), (2, v)\}$ .  $(R \subseteq A \times B)$ 

• We can also represent a binary relation R by a table showing the ordered pairs of R.

**Example**: Let 
$$A = \{0, 1, 2\}$$
 and  $B = \{u, v\}$ , and  $R = \{(0, u), (0, v), (1, u), (2, v)\}$ .  $(R \subseteq A \times B)$

#### Relations and Functions

• Relations represent one to many relationships between elements in A and B.

#### Relations and Functions

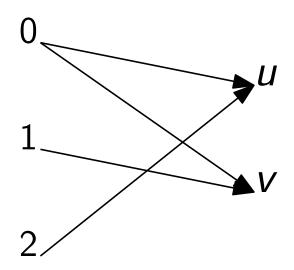

Relations represent one to many relationships between elements in A and B.

#### Relations and Functions

Relations represent one to many relationships between elements in A and B.

What is the difference between a relation and a function from A to B?

■ **Definition**: A relation on the set *A* is a relation from *A* to itself.

■ **Definition**: A relation on the set A is a relation from A to itself.

**Example**: Let  $A = \{1, 2, 3, 4\}$  and  $R_{div} = \{(a, b) : a|b\}$ . What does  $R_{div}$  consist of?

■ **Definition**: A relation on the set A is a relation from A to itself.

**Example**: Let  $A = \{1, 2, 3, 4\}$  and  $R_{div} = \{(a, b) : a|b\}$ . What does  $R_{div}$  consist of?

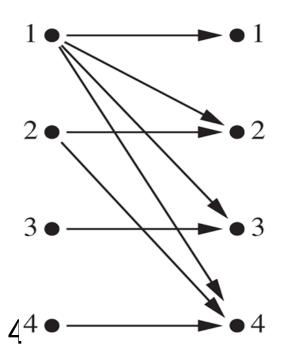

$$R_{div} = \{(1,1),(1,2),(1,3),(1,4),(2,2),(2,4),(3,3),(4,4)\}.$$

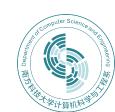

■ **Definition**: A relation on the set A is a relation from A to itself.

**Example**: Let  $A = \{1, 2, 3, 4\}$  and  $R_{div} = \{(a, b) : a|b\}$ . What does  $R_{div}$  consist of?

$$R_{div} = \{(1,1), (1,2), (1,3), (1,4), (2,2), (2,4), (3,3), (4,4)\}.$$

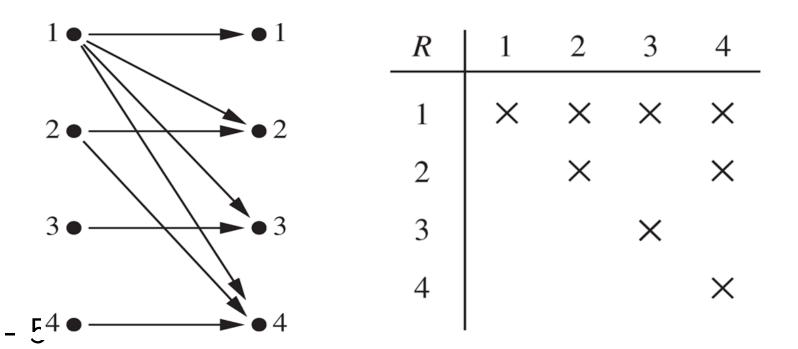

■ **Definition**: A relation on the set A is a relation from A to itself.

**Example**: Let  $A = \{1, 2, 3, 4\}$  and

 $R_{div} = \{(a, b) : a|b\}$ . What does  $R_{div}$  consist of?

$$R_{div} = \{(1,1), (1,2), (1,3), (1,4), (2,2), (2,4), (3,3), (4,4)\}.$$

**Theorem** The number of binary relations on a set A, where |A| = n is  $2^{n^2}$ .

**Theorem** The number of binary relations on a set A, where |A| = n is  $2^{n^2}$ .

#### **Proof**

If |A| = n, then the cardinality of the Cartesian product  $|A \times A| = n^2$ .

**Theorem** The number of binary relations on a set A, where |A| = n is  $2^{n^2}$ .

#### **Proof**

If |A| = n, then the cardinality of the Cartesian product  $|A \times A| = n^2$ .

R is a binary relation on A if  $R \subseteq A \times A$  (R is subset)

**Theorem** The number of binary relations on a set A, where |A| = n is  $2^{n^2}$ .

#### **Proof**

If |A| = n, then the cardinality of the Cartesian product  $|A \times A| = n^2$ .

R is a binary relation on A if  $R \subseteq A \times A$  (R is subset)

The number of subsets of a set with k elements is  $2^k$ 

#### Properties of Relations

■ Reflexive Relation: A relation R on a set A is called reflexive if  $(a, a) \in R$  for every element  $a \in A$ .

#### Properties of Relations

**Reflexive Relation**: A relation R on a set A is called *reflexive* if  $(a, a) \in R$  for every element  $a \in A$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

**Reflexive Relation**: A relation R on a set A is called *reflexive* if  $(a, a) \in R$  for every element  $a \in A$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  reflexive?

■ Reflexive Relation: A relation R on a set A is called reflexive if  $(a, a) \in R$  for every element  $a \in A$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  reflexive?

$$R_{div} = \{(1,1),(1,2),(1,3),(1,4),(2,2),(2,4),(3,3),(4,4)\}.$$

■ Reflexive Relation: A relation R on a set A is called reflexive if  $(a, a) \in R$  for every element  $a \in A$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  reflexive?

$$R_{div} = \{(1,1), (1,2), (1,3), (1,4), (2,2), (2,4), (3,3), (4,4)\}.$$

Yes. 
$$(1,1),(2,2),(3,3),(4,4) \in R_{div}$$

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{div} = \{(1,1), (1,2), (1,3), (1,4), (2,2), (2,4), (3,3), (4,4)\}.$$

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{div} = \{(1,1), (1,2), (1,3), (1,4), (2,2), (2,4), (3,3), (4,4)\}.$$

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{div} = \{(1,1),(1,2),(1,3),(1,4),(2,2),(2,4),(3,3),(4,4)\}.$$

A relation R is reflexive if and only if MR has 1 in every position on its main diagonal.

**Example**: Assume that  $R = \{(1,2), (2,2), (3,3)\}$  on  $A = \{1,2,3,4\}$ .

**Example**: Assume that  $R = \{(1,2), (2,2), (3,3)\}$  on  $A = \{1,2,3,4\}$ .

Is *R* reflexive?

**Example**: Assume that  $R = \{(1,2), (2,2), (3,3)\}$  on  $A = \{1,2,3,4\}$ .

Is *R* reflexive?

No.  $(1,1) \notin R$ 

■ Irreflexive Relation: A relation R on a set A is called *irreflexive* if  $(a, a) \notin R$  for every element  $a \in A$ .

**Irreflexive Relation**: A relation R on a set A is called *irreflexive* if  $(a, a) \notin R$  for every element  $a \in A$ .

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

■ Irreflexive Relation: A relation R on a set A is called *irreflexive* if  $(a, a) \notin R$  for every element  $a \in A$ .

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{\neq}$  irreflexive?

■ Irreflexive Relation: A relation R on a set A is called irreflexive if  $(a, a) \notin R$  for every element  $a \in A$ .

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{\neq}$  irreflexive?

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

■ Irreflexive Relation: A relation R on a set A is called irreflexive if  $(a, a) \notin R$  for every element  $a \in A$ .

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{\neq}$  irreflexive?

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

Yes. 
$$(1,1),(2,2),(3,3),(4,4) \notin R_{\neq}$$

#### Irreflexive Relation

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

#### Irreflexive Relation

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

$$MR = \begin{bmatrix} 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \end{bmatrix}$$

#### Irreflexive Relation

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

A relation R is irreflexive if and only if MR has 0 in every position on its main diagonal.

**Symmetric Relation**: A relation R on a set A is called symmetric if  $(b, a) \in R$  whenever  $(a, b) \in R$  for all  $a, b \in A$ .

**Symmetric Relation**: A relation R on a set A is called symmetric if  $(b, a) \in R$  whenever  $(a, b) \in R$  for all  $a, b \in A$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

**Symmetric Relation**: A relation R on a set A is called symmetric if  $(b, a) \in R$  whenever  $(a, b) \in R$  for all  $a, b \in A$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  symmetric?

**Symmetric Relation**: A relation R on a set A is called symmetric if  $(b, a) \in R$  whenever  $(a, b) \in R$  for all  $a, b \in A$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  symmetric?

$$R_{div} = \{(1,1),(1,2),(1,3),(1,4),(2,2),(2,4),(3,3),(4,4)\}.$$

**Symmetric Relation**: A relation R on a set A is called symmetric if  $(b, a) \in R$  whenever  $(a, b) \in R$  for all  $a, b \in A$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  symmetric?

$$R_{div} = \{(1,1),(1,2),(1,3),(1,4),(2,2),(2,4),(3,3),(4,4)\}.$$

No.  $(1,2) \in R_{div}$  but  $(2,1) \notin R$ 

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

Is  $R_{\neq}$  symmetric?

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

Is  $R_{\neq}$  symmetric?

Yes. If  $(a, b) \in R_{\neq}$  then  $(b, a) \in R_{\neq}$ .

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

$$MR = \begin{bmatrix} 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \end{bmatrix}$$

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

$$MR = \begin{bmatrix} 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \end{bmatrix}$$

A relation R is symmetric if and only if MR is symmetric.

**Antisymmetric Relation**: A relation R on a set A is called antisymmetric if (b, a) ∈ R and (a, b) ∈ R implies a = b for all a, b ∈ A.

**Antisymmetric Relation**: A relation R on a set A is called antisymmetric if (b, a) ∈ R and (a, b) ∈ R implies a = b for all a, b ∈ A.

**Example**: Assume that  $R = \{(1, 2), (2, 2), (3, 3)\}$  on  $A = \{1, 2, 3, 4\}$ .

**Antisymmetric Relation**: A relation R on a set A is called antisymmetric if (b, a) ∈ R and (a, b) ∈ R implies a = b for all a, b ∈ A.

**Example**: Assume that  $R = \{(1,2), (2,2), (3,3)\}$  on  $A = \{1,2,3,4\}$ .

Is R antisymmetric?

**Antisymmetric Relation**: A relation R on a set A is called antisymmetric if (b, a) ∈ R and (a, b) ∈ R implies a = b for all a, b ∈ A.

**Example**: Assume that  $R = \{(1, 2), (2, 2), (3, 3)\}$  on  $A = \{1, 2, 3, 4\}$ .

Is R antisymmetric?

Yes.

**Example**: Assume that  $R = \{(1,2), (2,2), (3,3)\}$  on  $A = \{1,2,3,4\}$ .

**Example**: Assume that  $R = \{(1,2), (2,2), (3,3)\}$  on  $A = \{1,2,3,4\}$ .

$$MR = \begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}$$

**Example**: Assume that  $R = \{(1,2), (2,2), (3,3)\}$  on  $A = \{1,2,3,4\}$ .

$$MR = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

A relation R is antisymmetric if and only if  $m_{ij} = 1$  implies  $m_{ji} = 0$  for  $i \neq j$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  antisymmetric?

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  antisymmetric?

$$R_{div} = \{(1,1),(1,2),(1,3),(1,4),(2,2),(2,4),(3,3),(4,4)\}.$$

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  antisymmetric?

$$R_{div} = \{(1,1), (1,2), (1,3), (1,4), (2,2), (2,4), (3,3), (4,4)\}.$$

Yes. If a|b and b|a, then a=b.

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  antisymmetric?

$$R_{div} = \{(1,1),(1,2),(1,3),(1,4),(2,2),(2,4),(3,3),(4,4)\}.$$

Yes. If a|b and b|a, then a=b.

**Transitive Relation**: A relation R on a set A is called *transitive* if (a, b) ∈ R and (b, c) ∈ R implies (a, c) ∈ R for all a, b, c ∈ A.

**Transitive Relation**: A relation R on a set A is called *transitive* if  $(a, b) \in R$  and  $(b, c) \in R$  implies  $(a, c) \in R$  for all  $a, b, c \in A$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

**Transitive Relation**: A relation R on a set A is called *transitive* if (a, b) ∈ R and (b, c) ∈ R implies (a, c) ∈ R for all a, b, c ∈ A.

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  transitive?

**Transitive Relation**: A relation R on a set A is called *transitive* if  $(a, b) \in R$  and  $(b, c) \in R$  implies  $(a, c) \in R$  for all  $a, b, c \in A$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  transitive?

$$R_{div} = \{(1,1),(1,2),(1,3),(1,4),(2,2),(2,4),(3,3),(4,4)\}.$$

**Transitive Relation**: A relation R on a set A is called *transitive* if  $(a, b) \in R$  and  $(b, c) \in R$  implies  $(a, c) \in R$  for all  $a, b, c \in A$ .

**Example**: Assume that  $R_{div} = \{(a, b) : a|b\}$  on  $A = \{1, 2, 3, 4\}$ .

Is  $R_{div}$  transitive?

$$R_{div} = \{(1,1),(1,2),(1,3),(1,4),(2,2),(2,4),(3,3),(4,4)\}.$$

Yes. If a|b and b|c, then a|c.

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

Is  $R_{\neq}$  transitive?

**Example**: Assume that  $R_{\neq} = \{(a, b) : a \neq b\}$  on  $A = \{1, 2, 3, 4\}$ .

$$R_{\neq} = \{(1,2), (1,3), (1,4), (2,1), (2,3), (2,4), (3,1), (3,2), (3,4), (4,1), (4,2), (4,3)\}.$$

Is  $R_{\neq}$  transitive?

No.  $(1,2),(2,1)\in R_{\neq}$  but  $(1,1)\notin R_{\neq}$ .

**Example**: Assume that  $R = \{(1,2), (2,2), (3,3)\}$  on  $A = \{1,2,3,4\}$ .

**Example**: Assume that  $R = \{(1,2), (2,2), (3,3)\}$  on  $A = \{1,2,3,4\}$ .

Is R transitive?

**Example**: Assume that  $R = \{(1,2), (2,2), (3,3)\}$  on  $A = \{1,2,3,4\}$ .

Is R transitive?

Yes.

**Definition**: Let A and B be two sets. A binary relation from A to B is a subset of a Cartesian product  $A \times B$ .

Let  $R \subseteq A \times B$  denote R is a set of ordered pairs of the form (a, b) where  $a \in A$  and  $b \in B$ .

**Definition**: Let A and B be two sets. A binary relation from A to B is a subset of a Cartesian product  $A \times B$ .

Let  $R \subseteq A \times B$  denote R is a set of ordered pairs of the form (a, b) where  $a \in A$  and  $b \in B$ .

**Combining Relations**: Since relations are sets, we can *combine* relations via set operations.

**Definition**: Let A and B be two sets. A binary relation from A to B is a subset of a Cartesian product  $A \times B$ .

Let  $R \subseteq A \times B$  denote R is a set of ordered pairs of the form (a, b) where  $a \in A$  and  $b \in B$ .

**Combining Relations**: Since relations are sets, we can *combine* relations via set operations.

Set operations: union, intersection, difference, etc.

**Example**: Let  $A = \{1, 2, 3\}$ ,  $B = \{u, v\}$ , and  $R_1 = \{(1, u), (2, u), (2, v), (3, u)\}$ ,  $R_2 = \{(1, v), (3, u), (3, v)\}$ 

**Example**: Let  $A = \{1, 2, 3\}$ ,  $B = \{u, v\}$ , and  $R_1 = \{(1, u), (2, u), (2, v), (3, u)\}$ ,  $R_2 = \{(1, v), (3, u), (3, v)\}$ 

What is  $R_1 \cup R_2$ ,  $R_1 \cap R_2$ ,  $R_1 - R_2$ ,  $R_2 - R_1$ ?

**Example**: Let  $A = \{1, 2, 3\}$ ,  $B = \{u, v\}$ , and  $R_1 = \{(1, u), (2, u), (2, v), (3, u)\}$ ,  $R_2 = \{(1, v), (3, u), (3, v)\}$ 

What is  $R_1 \cup R_2$ ,  $R_1 \cap R_2$ ,  $R_1 - R_2$ ,  $R_2 - R_1$ ?

We may also combine relations by matrix operations.

■ **Definition**: Let R be a relation from a set A to a set B and S be a relation from B to C. The composite of R and S is the relation consisting of the ordered pairs (a, c) where  $a \in A$  and  $c \in C$  and for which there is a  $b \in B$  such that  $(a, b) \in R$  and  $(b, c) \in S$ . We denote the composite of R and S by  $S \circ R$ .

■ **Definition**: Let R be a relation from a set A to a set B and S be a relation from B to C. The composite of R and S is the relation consisting of the ordered pairs (a, c) where  $a \in A$  and  $c \in C$  and for which there is a  $b \in B$  such that  $(a, b) \in R$  and  $(b, c) \in S$ . We denote the composite of R and S by  $S \circ R$ .

**Example**: Let  $A = \{1, 2, 3\}$ ,  $B = \{0, 1, 2\}$ , and  $C = \{a, b\}$ 

■ **Definition**: Let R be a relation from a set A to a set B and S be a relation from B to C. The composite of R and S is the relation consisting of the ordered pairs (a, c) where  $a \in A$  and  $c \in C$  and for which there is a  $b \in B$  such that  $(a, b) \in R$  and  $(b, c) \in S$ . We denote the composite of R and S by  $S \circ R$ .

**Example**: Let  $A = \{1, 2, 3\}$ ,  $B = \{0, 1, 2\}$ , and  $C = \{a, b\}$ 

$$R = \{(1,0), (1,2), (3,1), (3,2)\}$$
$$S = \{(0,b), (1,a), (2,b)\}$$

■ **Definition**: Let R be a relation from a set A to a set B and S be a relation from B to C. ### Composite of Relations

**Definition** Let R be a relation on A. The *powers*  $R^n$ , for n = 1, 2, 3, ..., is defined inductively by

$$R^1 = R$$
 and  $R^{n+1} = R^n \circ R$ 

**Example**: Let 
$$A = \{1, 2, 3, 4\}$$
, and  $R = \{(1, 2), (2, 3), (2, 4), (3, 3)\}$ 

$$R^1 = R$$

$$R^2 = R \circ R = \{(1,3), (1,4), (2,3), (3,3)\}$$

$$R^3 = R^2 \circ R = \{(1,3), (2,3), (3,3)\}$$

$$R^4 = R^3 \circ R = \{(1,3),(2,3),(3,3)\}$$

$$R^{k} = ? \text{ for } k > 3$$

**Theorem** The relation R on a set A is transitive if and only if  $R^n \subseteq R$  for n = 1, 2, 3, ...

**Theorem** The relation R on a set A is transitive if and only if  $R^n \subseteq R$  for n = 1, 2, 3, ...

Proof.

■ **Theorem** The relation R on a set A is transitive if and only if  $R^n \subseteq R$  for n = 1, 2, 3, ...

#### Proof.

"if" part: In particular,  $R^2 \subseteq R$ .

**Theorem** The relation R on a set A is transitive if and only if  $R^n \subseteq R$  for n = 1, 2, 3, ...

#### Proof.

```
"if" part: In particular, R^2 \subseteq R.
```

If  $(a, b) \in R$  and  $(b, c) \in R$ , then by the definition of composition, we have  $(a, c) \in R^2 \subseteq R$ .

**Theorem** The relation R on a set A is transitive if and only if  $R^n \subseteq R$  for n = 1, 2, 3, ...

#### Proof.

```
"if" part: In particular, R^2 \subseteq R.
```

If  $(a, b) \in R$  and  $(b, c) \in R$ , then by the definition of composition, we have  $(a, c) \in R^2 \subseteq R$ .

"only if" part: by induction.

**Theorem** The number of reflexive relations on a set A with |A| = n is  $2^{n(n-1)}$ .

**Theorem** The number of reflexive relations on a set A with |A| = n is  $2^{n(n-1)}$ .

**Proof.** A reflexive relation R on A must contain all pairs (a, a) for every  $a \in A$ .

■ **Theorem** The number of reflexive relations on a set A with |A| = n is  $2^{n(n-1)}$ .

**Proof.** A reflexive relation R on A must contain all pairs (a, a) for every  $a \in A$ .

All other pairs in R are of the form (a, b) with  $a \neq b$  s.t.  $a, b \in A$ .

■ **Theorem** The number of reflexive relations on a set A with |A| = n is  $2^{n(n-1)}$ .

**Proof.** A reflexive relation R on A must contain all pairs (a, a) for every  $a \in A$ .

All other pairs in R are of the form (a, b) with  $a \neq b$  s.t.  $a, b \in A$ .

How many of these pairs are there?

■ **Theorem** The number of reflexive relations on a set A with |A| = n is  $2^{n(n-1)}$ .

**Proof.** A reflexive relation R on A must contain all pairs (a, a) for every  $a \in A$ .
